The IO-AI8 is an I/O Expansion Module that can be used in conjunction with specific Unitronics OPLC controllers. The module offers 8 analog inputs. The interface between the module and the OPLC is provided by an adapter. The module may either be snap-mounted on a DIN rail, or screw-mounted onto a mounting plate.

Before using this product, it is the responsibility of the user to read and understand this document and any accompanying documentation.

- All examples and diagrams shown herein are intended to aid understanding, and do not guarantee operation. Unitronics accepts no responsibility for actual use of this product based on these examples.
- Please dispose of this product in accordance with local and national standards and regulations.
- Only qualified service personnel should open this device or carry out repairs.

### User safety and equipment protection guidelines

This document is intended to aid trained and competent personnel in the installation of this equipment as defined by the European directives for machinery, low voltage, and EMC. Only a technician or engineer trained in the local and national electrical standards should perform tasks associated with the device’s electrical wiring.

Symbols are used to highlight information relating to the user’s personal safety and equipment protection throughout this document. When these symbols appear, the associated information must be read carefully and understood fully.

<table>

<td>Caution</td>
<td>Use caution.</td>
</tr>
</tbody>
</table>

Failure to comply with appropriate safety guidelines can result in severe personal injury or property damage. Always exercise proper caution when working with electrical equipment.
- Check the user program before running it.
- Do not attempt to use this device with parameters that exceed permissible levels.
- To avoid damaging the system, do not connect / disconnect the device when the power is on.

Environmental Considerations

- Do not install in areas with: excessive or conductive dust, corrosive or flammable gas, moisture or rain, excessive heat, regular impact shocks or excessive vibration.
- Leave a minimum of 10mm space for ventilation between the top and bottom edges of the device and the enclosure walls.
- Do not place in water or let water leak onto the unit.
- Do not allow debris to fall inside the unit during installation.

Mounting the Module

DIN-rail mounting
Snap the device onto the DIN rail as shown below; the module will be squarely situated on the DIN rail.
**Screw-Mounting**

The figure below is not drawn to scale. It may be used as a guide for screw-mounting the module.

Mounting screw type: either M3 or NC6-32.

![Screw-Mounting Diagram](image)

**Connecting Expansion Modules**

An adapter provides the interface between the OPLC and an expansion module. To connect the I/O module to the adapter or to another module:

- Push the module-to-module connector into the port located on the right side of the device.
- Note that there is a protective cap provided with the adapter. This cap covers the port of the final I/O module in the system.

To avoid damaging the system, do not connect or disconnect the device when the power is on.

Unitronics
Wiring

- Do not touch live wires.
- Unused pins should not be connected. Ignoring this directive may damage the device.
- Do not connect the 'Neutral or 'Line' signal of the 110/220VAC to the device's COM pins.
- Double-check all wiring before turning on the power supply.

Wiring Procedures

Use crimp terminals for wiring; use 26-12 AWG wire (0.13 mm²–3.31 mm²) for all wiring purposes.

1. Strip the wire to a length of 7±0.5mm (0.250–0.300”).
2. Unscrew the terminal to its widest position before inserting a wire.
3. Insert the wire completely into the terminal to ensure that a proper connection can be made.
4. Tighten enough to keep the wire from pulling free.

- To avoid damaging the wire, do not exceed a maximum torque of 0.5 N·m (5 kgf·m).
- Do not use tin, solder, or any substance on stripped wire that might cause the wire strand to break.
- Install at maximum distance from high-voltage cables and power equipment.

I/O Wiring—General

- Input or output cables should not be run through the same multi-core cable or share the same wire.
- Allow for voltage drop and noise interference with input lines used over an extended distance. Use wire that is properly sized for the load.

Analog Inputs

- Shields should be connected at the signal source.
- Inputs may be set as either current, or voltage. To set an input
- Use the appropriate wiring as shown near.
- Open the device and set the jumpers according to the instructions beginning on page 5.
- The adapter and the COM signals of the analog inputs must be connected to the same 0V signal.
- The COM signals of each channel are internally shorted.

When set to current/voltage, each 2 inputs share a common COM signal.
Opening the Device

- Before opening the device, touch a grounded object to discharge any electrostatic charge.
- Avoid touching the PCB board directly.
- Turn power off and disconnect all leads before opening the device.

In order to change the jumper settings of a specific input, first open the device by prying off its back, using the blade of a flat-bladed screwdriver. The insertion points for the screwdriver are located on both sides of the module.

1. Open the first side of the device by inserting the blade between the 2 plastic moldings as shown below, then gently pushing up.

2. Taking care not to damage the cable, open the other side of the device by inserting the blade where shown below, then gently pushing up.

3. Gently remove the top of the device as shown.
4. The jumpers are shown at right. Change the jumper settings as required, in accordance with the tables shown on the next page.

### Jumper Settings

The tables below show how to set a specific jumper to change the functionality of a specific input. To open the device and access the jumpers, refer to the instructions beginning on page 5.

**Caution**

- Incompatible jumper settings and wiring may severely damage the device.

IO-AI8 Technical Specifications

Max. current consumption 40mA maximum from the adapter’s 5VDC
Typical power consumption 0.2W@5VDC
Status indicator
(RUN) Green LED:
—Lit when a communication link is established between module and OPLC.
—Blinks when the communication link fails.

Analog Inputs
Number of inputs 8 (single-ended) See Note 1.
Input range 0-10V, 0-20mA, 4-20mA. See Note 1.
Input type Either Normal or Fast mode, according to the filter type selected in software settings.
Conversion method Voltage to frequency
Normal mode
Resolution at 0-10V, 0-20mA 14-bit (16384 units)
Resolution at 4-20mA 3277 to 16383 (13107 units)
Conversion time 100mSec minimum per input
Fast mode
Resolution at 0-10V, 0-20mA 12-bit (4096 units)
Resolution at 4-20mA 819 to 4095 (3277 units)
Conversion time 25mSec minimum per input
Input impedance >400KΩ — voltage
500Ω — current
Isolation None
Absolute maximum rating ±15V — voltage
±30mA — current
Linearity error 0.04% max of full scale
Error limits 0.4% of input value
Status indicators
(OUT OF RANGE) Red LEDs—Lit when the corresponding input is receiving current or voltage in excess of the input range. See Note 5.

Environmental
IP20/NEMA1
Operating temperature 0° to 50°C (32 to 122° F)
Storage temperature -20° to 60°C (-4 to 140° F)
Relative Humidity (RH) 5% to 95% (non-condensing)
Dimensions (WxHxD) 80mm x 93mm x 60mm (3.15 x 3.66 x 2.362”)
Weight 150g (5.3 oz)
Mounting Either onto a 35mm DIN-rail or screw- mounted.

Notes:
1. Each input may be set as either voltage (0-10V), or current (0-20mA, 4-20mA) via wiring, jumper and software settings.
2. The voltage or current value of analog inputs can also indicate faults, as shown in the table below.

<table>

Addressing I/Os on Expansion Modules

Inputs and outputs located on I/O expansion modules that are connected to an OPLC are assigned addresses that comprise a letter and a number. The letter indicates whether the I/O is an input (I) or an output (O). The number indicates the I/O’s location in the system. This number relates to both the position of the expansion module in the system, and to the position of the I/O on that module.

Expansion modules are numbered from 0-7 as shown in the figure below.

![Expansion Module Identification Number](image)

The number that represents the I/O’s location is equal to:

\[32 + x \cdot 16 + y\]

Examples

- **Input #3**, located on expansion module #2 in the system, will be addressed as I 67,
  \[67 = 32 + 2 \cdot 16 + 3\]
- **Output #4**, located on expansion module #3 in the system, will be addressed as O 84,
  \[84 = 32 + 3 \cdot 16 + 4\]

EX90-DI8-RO8 is a stand-alone I/O module. Even if it is the only module in the configuration, the EX90-DI8-RO8 is always assigned the number 7.

Its I/Os are addressed accordingly.

Example

- **Input #5**, located on an EX90-DI8-RO8 connected to an OPLC will be addressed as I 149,
  \[149 = 32 + 7 \cdot 16 + 5\]
